Overview of Summer clothes Sales Performance

Total units sold

6M

Average of rating

3.84

Inventory Level

45K

Average number of destination countries by Country of origin

Total number of units sold reached **more than 6 million** units worldwide, with products ranging from different categories in summer theme.

- Inventory Level for all of product variations combined is roughly **45,000 units**;
- Average rating of all products is **3.84 stars**;
- The countries of origin of the products are categorized in 6 countries: 2 in Europe (Austria, United Kingdom), 2 in America (United States, Venezuela), and 2 in Asia (China, Singapore). Note that 7th category is named "Unknown", indicating that there are missing data fields for origin country for some products;
- While most units sold were originated from China, **Austria was the country with the highest average number of destination countries** where the products were shipped to. This means that on average, a product line originated from Austria was shipped to many countries compared to others.

Overview of Summer clothes Sales Performance

Most sold units are **small sizes** (XS and XXS) and have **bright hot colors** (i.e., yellow and red). This could be related to our highest sales are in women clothing such as dresses and bikinis, thus more vibrant colors and smaller sizes would be preferred. For yellow-colored products, **217,00 units** have been sold in a total of 6 million sold products. And for XS-sized products, more than **830,000 units** have been sold in total of 6 million (which is around 13.8% of our total sales).

Sales performance by Country of origin

Products sold (in units) by origin country
Total units sold and Percentage of total units sold by country of origin

As indicated, China has the highest number of units sold in total, accounting for approximately 97.32% of our total sales, which is around 6 million units sold.

Other unknown countries made up for 1.68% (108500 units sold), US for 0.67% (43210 units sold), and UK for 0.02% (1000 units sold).

Austria and Venezuela accounted for the least number of our total sales, with only 100 and 250 units sold, respectively.

Country of origin	Country Name	% of total units sold	Sum of units_sold
	Unknown	1.68%	108500
AT	Austria	0.00%	100
CN	China	97.32%	6291349
GB	United Kingdom	0.02%	1000
SG	Singapore	0.31%	20100
US	United States	0.67%	43210
VE	Venezuela	0.00%	250
Total		100.00%	6464509

What is the average original retail price vs final price of products in each country?

Average of retail_price and Average of price by Country

● Average of retail_price ● Average of price

On average, retail price was much higher than final product price (thus expected revenue was higher than actual revenue). Though the following graph didn't take into account price difference among different product categories, it showed an overview and comparison of product prices among countries as well as the difference between retail and actual price.

United States seemingly had the highest retail price, but not that high actual product price as it was similar to that of Venezuela and China.

United Kingdom, Austria, and Singapore had a smaller gap between retail and actual product price, with only around 0.1-1 euro difference.

Potential key factors in driving products sales

Our products had different categories that might have or have not influenced our customers' choices of purchasing the products. In our analysis, we see that the number of products sold that were without badges in terms of quality, locality, and fast shipping were significantly higher than that with the corresponding badges. While there might not be a correlation, interestingly, the **number of units sold that were without the badges were almost 5 to 6 times more than those with the badges in the same category.**

On the other hand, considering ad boost, the number of units sold that had used ad boost was around 2.7 million units, compared to ones without the ad boost which was 3.8 million. Though without using ad boost, the total number of units sold was more than those with the boost, **using ad boost is still an important strategy for brand awareness and influencing purchase decision.**

Impact of Ad Boosting on Sales

Total number of units sold by Badge for quality

Total number of units sold by Badge for local product

Total number of units sold by Badge for fast shipping

Retail price of the products were generally higher than the actual price of the product. Notably, the price difference (price increase) in decimal number took a negative values when the retail price is significantly higher than the actual price, estimating around -0.9 to -0.8 here (which means the actual price is around 90% - 80% lower than the retail price).
